SKIING

ALPINE, RANDONEE, TELEMARK

PRODUCT INFORMATION

WHICH SKIS ARE RIGHT FOR YOU?

Choosing the right skis primarily involves matching your terrain preferences (Groomed slopes? Off-piste?) with an appropriate ski design (All-mountain? Powder? Backcountry?).

Decide which kind of skiing you do most often by answering the following questions. Then connect your answer with the ski categories below to find a ski type that best suits you.

- **Do you only ski lift-accessed, groomed runs (inbounds)? Choose ❶.**
- **Do you ski groomed runs, powder, and sometimes out-of-bounds areas? Choose ❶, ❷, ❸ or ❹.**
- **Do you ride the lifts to access the out-of-bounds/backcountry terrain and only ski there? Choose ❷, ❸ or ❹.**
- **Do you hike uphill on your skis to access backcountry terrain for skiing? Choose ❷, ❸ or ❹.**
- **Do you ride the lifts to ski the park and pipe terrain? Choose ❹.**

SKI CATEGORIES

Skis can generally be divided into 5 categories, determined by the type of terrain, conditions encountered, and intended use.

- ❶ **All-Mountain:** Skis are either integrated or flat (sold without bindings) and generally have a waist of intermediate width to balance quickness and flotation.
- ❷ **All-Mountain Wide:** These skis are mostly sold flat (not integrated with bindings) and are designed to perform in various conditions—from powder to packed snow. Twin-tip skis in this category are constructed primarily for directional skiing, with the twin-tip tail designed to allow the skier to adjust his or her turn shape more freely.
- ❸ **Powder:** With a broad platform and wide waists, these skis provide flotation for deep, light snow. Most include “rocker tech,” which helps the skier to float in powder and soft snow.
- ❹ **Backcountry:** Skis are generally lighter than alpine skis. They will accommodate telemark and randonee bindings with re-enforced top sheets in the binding areas.
- ❺ **Twin-Tip/Freestyle:** These skis hold an edge in the park, ski solidly in reverse, and feature technology that helps to soften landings.

What about **ability level**? Ski technology has progressed to a point where nearly any novice

can hop on nearly any ski and have fun, particularly on easy-to-turn all-mountain skis. As a result, skiers have much less need to focus on traditional classifications—beginner (Type I), intermediate (Type II) or advanced (Type III)—that have long influenced the ski-selection process. True, expert-level skiers can fine-tune their performance by paying attention to subtle differences in flex or sidecut. For most skiers, though, it's more important to match your ski to the terrain you most frequently seek out.

PROFILE DIMENSIONS

These measurements identify the width of the ski in 3 places: tip (or shovel)/waist (middle)/tail.

The most critical measurement is waist width. Narrow waists allow you to establish an edge sooner, resulting in lively, smooth turns. These skis respond well on groomed runs; they're quick to shift from edge to edge, giving the skis a nimble feel. Wider waists deliver more surface area, creating more contact with the snow. Such skis are better able to float atop soft snow and powder.

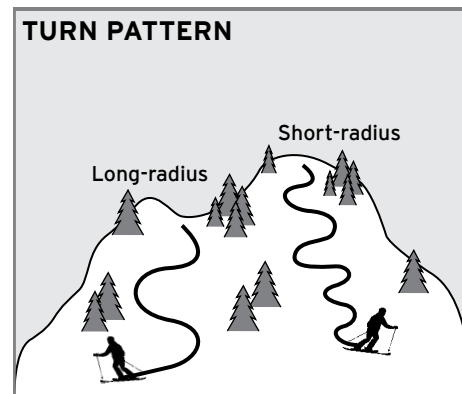

When you combine these dimensions with sidecut radius and length, you get an idea of the type of performance you can expect from a ski.

SIDECUT RADIUS (AKA TURNING RADIUS)

Sidecut is the arc or curve created by the edge of a ski. Imagine if that arc was extended until it formed a circle. A line drawn from the center of that circle back to the edge of the ski determines a ski's sidecut radius. It is measured in meters.

What does that number tell you? The lower the number, the quicker a ski will turn.

Skis with low sidecut radius numbers (low to mid teens) are better for making tight, **short-radius** turns (though they can make longer turns just fine). Higher numbers indicate skis better suited for **long-radius** turns (and fast descents).

For example, many all-mountain skis have a deep, curvy sidecut that forms an easy-turning hourglass shape. The result: a low sidecut radius number. Powder skis, meanwhile, have a shallow sidecut (and higher number). They may be less nimble in turns, but they float well on soft snow.

LENGTH

Several factors (weight, experience, terrain) will influence your choice of length, though your height is often the most vital. In general, with ski tails on the floor, ski tips should touch your face approximately between your nose and eyebrows. Shorter skis are easier to turn; longer ski are good for speed. Experienced skiers often prefer longer skis. Ask an REI ski specialist for assistance to determine the best length for you.

WOMEN'S VS. MEN'S SKIS

Women-specific models are typically lighter and shorter, making them easier to maneuver than comparable men's skis. This minimizes fatigue without compromising performance.

Women's bindings can be mounted a little further forward on skis than men's bindings, accommodating a woman's lower center of gravity, enhancing balance and responsiveness.

BINDINGS

Bindings can vary significantly and need to be compatible with the type of skiing you do, your boots (this is essential) and your budget.

INTEGRATED BINDINGS

Designed for a specific pair of skis, packaged as a system. They tend to flex naturally, offer good edge-hold and permit easy turning.

NONINTEGRATED BINDINGS

Intermediate: Designed for easy entry.

Advanced: Usually higher in price, with features often important only to sophisticated skiers, such as greater retention.

RANDONEE BINDINGS

Used mostly for accessing backcountry, rando bindings allow skiers to stride in a free-heeled mode (for climbing) and lock heels in place for parallel (traditional downhill) skiing.

TELEMARK BINDINGS

They provide full-time free-heel movement during backcountry climbs and descents. Some allow the binding to pivot at the toe instead of at the ball of the foot for easier uphill hiking.

In the backcountry, **always** carry an avalanche transceiver, shovel and probe. Also bring skins, a helmet and a pack with food and extra clothing.

Volkl Katana	790216	(176cm) 141/111/131	(176cm) 22.8	176, 183, 190, 197		Good	Best			\$899	

FOOTNOTES: *Prices subject to change and are for comparison only. †Please see a sales specialist for information about brand-name technologies. Laminate construction involves material (usually metal, titanium or carbon) that adds stiffness and edge-hold. ‡Tip/waist/tail dimensions. §Reverse camber helps ski stay on surface in deep snow. **Available online only. NA = not applicable; UA = spec unavailable. Specs based on manufacturers' information available at time of publication.

Visit REI.com/skiing for more items and expert advice.

Free shipping to any REI store; some restrictions apply. For details, visit REI.com or call 1-800-426-4840.
