

SKIING

DOWNHILL AND BACKCOUNTRY

PRODUCT INFORMATION

WHICH SKIS ARE RIGHT FOR YOU?

Choosing the right skis primarily involves matching your terrain preferences (Groomed slopes? Off-piste?) with an appropriate ski design (All-mountain? Powder? Backcountry?).

Determine which kind of skiing you do most often by answering the following questions. Then connect your answer with the ski categories below to find a ski type that best suits you.

- **Do you only ski lift-accessed, groomed runs (inbounds)?** Choose **1**.
- **Do you ski groomed runs, powder and sometimes out-of-bounds areas?** Choose **1, 2, 3** or **4**.
- **Do you ride the lifts to access the out-of-bounds/backcountry terrain and only ski there?** Choose **2, 3** or **4**.
- **Do you hike uphill on your skis to access backcountry terrain for skiing?** Choose **2, 3** or **4**.
- **Do you ride the lifts to ski the park and pipe terrain?** Choose **5**.

SKI CATEGORIES

Skis can generally be divided into 5 categories, determined by the type of terrain, conditions encountered and intended use.

- 1 All-Mountain:** Skis are either integrated or flat (sold without bindings) and generally have a waist of intermediate width to balance quickness and flotation. Most include rocker technology, which helps the skier to float in powder and soft snow.
- 2 All-Mountain Wide:** These skis are mostly sold flat (not integrated with bindings) and are designed to perform in various conditions—from powder to packed snow. Twin-tip skis in this category are constructed primarily for directional skiing, with the twin-tip tail designed to allow the skier to adjust his or her turn shape more freely. Most include rocker technology, which helps the skier to float in powder and soft snow.
- 3 Powder:** With a broad platform and wide waists, these skis provide flotation for deep, light snow. Most include rocker technology, which helps the skier to float in powder and soft snow.
- 4 Backcountry:** Skis are generally lighter than downhill skis. They will accommodate telemark and randonee bindings with reinforced top sheets in the binding areas.

5 Freestyle Twin-Tip: These skis hold an edge in the park, ski solidly in reverse and feature technology that helps to soften landings.

What about **ability level**? Ski technology has progressed to a point where nearly any novice can hop on nearly any ski and have fun, particularly on rocker all-mountain skis. As a result, skiers have much less need to focus on traditional classifications—beginner (Type I), intermediate (Type II) or advanced (Type III)—that have long influenced the ski-selection process. True, expert-level skiers can fine-tune their performance by paying attention to subtle differences in flex or sidecut. For most skiers, though, it's more important to match your ski to the terrain you most frequently seek out.

PROFILE DIMENSIONS

These measurements identify the width of the ski in 3 places: tip (or shovel)/waist (middle)/tail.

The most critical measurement is waist width. Narrow waists allow you to establish an edge sooner, resulting in lively, smooth turns. These skis respond well on groomed runs; they're quick to shift from edge to edge, giving the skis a nimble feel. Wider waists deliver more surface area, creating more contact with the snow. Such skis are better able to float atop soft snow and powder.

When you combine these dimensions with sidecut radius and length, you get an idea of the type of performance you can expect from a ski.

SIDECUT RADIUS (A.K.A. TURN RADIUS)

Sidecut is the arc or curve created by the edge of a ski. Imagine if that arc was extended until it formed a circle. A line drawn from the center of that circle back to the edge of the ski determines a ski's sidecut radius. It is measured in meters.

What does that number tell you? The lower the number, the quicker a ski will turn.

For example, many all-mountain skis have a deep, curvy sidecut that forms an easy-turning hourglass shape. The result: a low sidecut radius number. Powder skis, meanwhile, have a shallow sidecut (and higher number). They may be less nimble in turns, but they float well on soft snow.

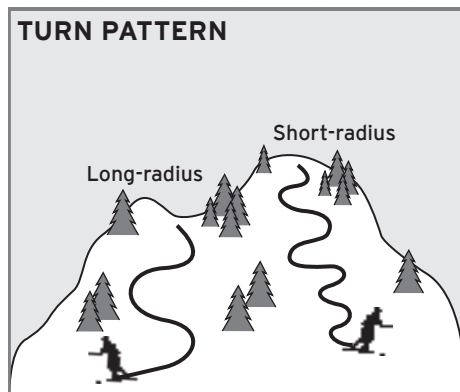

LENGTH

Several factors (weight, experience, terrain) will influence your choice of length, though your height is often the most vital. In general, with ski tails on the floor, ski tips should touch your face approximately between your nose and eyebrows. Shorter skis are easier to turn; longer skis are good for speed. Experienced skiers often prefer longer skis. Ask an REI ski specialist for assistance to determine the best length for you.

WOMEN'S VS. MEN'S SKIS

Women-specific models are typically lighter and shorter, making them easier to maneuver than comparable men's skis. This minimizes fatigue without compromising performance.

Women's bindings can be mounted a little farther forward on skis than men's bindings, accommodating a woman's lower center of gravity, enhancing balance and responsiveness.
